Scenario 1 — Search Functionality

Instruction:

Create functional test cases for the search functionality of Amazon.com.

- **[Strict]** Create only positive test cases. Do not include negative test cases.
- **[Mandatory]** Include test cases validating search functionality for both logged-in users and guest (non-logged-in) users.
- Verify that the search results are relevant to the submitted search terms.
- **[Strict]** Do not add any Performance or Security related test cases

Context:

For Amazon.com I want to come up with scenarios to validate the search functionality for logged in users and Guest users.

Persona:

Think like a Senior QA with 10 years of experience in ecommerce domain

Output:

Provide the test cases in a table with the following columns:

TC # | TC Name | TC Description | Expected Result

Tone:

Follow QA industry standards

Scenario 02 - File Upload

Instruction:
Create functional test cases for the file-upload functionality on Smallpdf.com.

- **[Strict]** Include both positive and negative test cases.
- **[Mandatory]** Include test cases that validate successful uploading of valid PDF files.
- **[Mandatory]** Include test cases that validate error handling for unsupported file formats and files exceeding the permitted file size.
- Validate that the application displays appropriate feedback when an upload succeeds or fails.
- **[Strict]** Do not add any Performance or Security related test cases

Context:
I want to validate the file-upload functionality of Smallpdf.com, covering both positive and negative scenarios.

- The supported file format for this scenario is PDF.
- The maximum permitted file size is 50MB.
- The application should accept only PDF and provide appropriate error feedback for invalid files.

Persona:
Think like a Senior QA with 10 years of experience in web application testing.

Output:
Provide the test cases in a table with the following columns:

TC # | TC Name | TC Description | Expected Result

Tone:
Follow QA industry standards

Scenario 05 - API Testing

Instruction:
Create functional API test cases for user registration in ReqRes.

- **[Strict]** Include both positive and negative test cases.
- **[Mandatory]** Include successful registration using valid user details.
- **[Mandatory]** Include failure using invalid user details.
- **[Mandatory]** Cover test cases for validating Status codes, response messages, payloads.
- **[Mandatory]** Include duplicate registration using the details of already registered user.

Context:
Using Postman I want to validate the user registration using API in ReqRes. We can use the API documentation available for identifying the endpoints.

Persona:
Think like a Senior QA with 10 years of experience in API Testing using Postman.

Output:
Provide the test cases in a table with the following columns:

TC # | TC Name | TC Description | Expected Result

Tone:
Follow QA industry standards.
